**Amendments to the Claims:**

This listing of claims will replace all prior versions and listings of claims in the application:

**Listing of Claims:**

1. (currently amended) A data storage system comprising:  
a plurality of storage nodes;  
data storage mechanisms implemented in each storage node;  
a communication medium linking storage nodes; and  
data distributed across a ~~selected~~ set of the storage nodes selected based on state information corresponding to the storage nodes such that the data remains available irrespective of the unavailability of one or more of the storage nodes within the selected set, wherein the data storage mechanisms on at least two storage nodes collectively implement a unitary volume of network storage.

Claim 2 (canceled)

3. (original) The data storage system of claim 1 wherein the communication medium comprises:  
a public network for receiving access requests for the data storage system;  
and

a private network enabling communication between storage nodes.

4. (original) The data storage system of claim 3 wherein the public network comprises the Internet.

5. (original) The data storage system of claim 3 wherein the private network comprises a virtual private network implemented over the Internet.

Serial No. 09/777,139

Reply to Office Action of September 9, 2005

6. (original) The data storage system of claim 1 further comprising:  
communication processes implemented within each of the storage nodes  
operable to exchange state information between at least some of the other data  
storage nodes.
7. (original) The data storage system of claim 1 wherein each of the  
data storage nodes further comprises data structures configured to store state  
information about one or more other nodes and the communication links between  
them.
8. (original) The data storage system of claim 7 wherein the state  
information comprises information selected from the group consisting of but not  
limited to: availability information, capacity information, quality of service  
information, performance information, geographical location information, network  
topological location information.
9. (original) The data storage system of claim 8 wherein the set of  
storage nodes is selected by a first of the storage nodes using the state information  
stored in the first of the storage nodes.
10. (previously presented) A data storage system comprising:  
a plurality of storage nodes wherein each of the data storage nodes further  
comprises data structures configured to store state information about one or more  
other nodes and the communication links between them;  
data storage mechanisms implemented in each storage node;  
a communication medium linking storage nodes;  
communication processes implemented within each of the storage nodes  
operable to exchange state information between at least some of the other data  
storage nodes;

Serial No. 09/777,139

data distributed across a selected set of the storage nodes such that the data remains available irrespective of the unavailability of one or more of the storage nodes within the selected set; and

wherein the communication processes implement a repetitive peer-to-peer conversation between the set of storage nodes enabling the state information contained in the state information data structures within each individual node to represent a consistent view of the state of the collection of storage nodes.

11. (original) The data storage system of claim 1 wherein the network comprises:

a plurality of first level networks, each first level network coupling multiple storage nodes; and

a second level network coupling at least two of the first level networks.

12. (original) The data storage system of claim 11 wherein the first level network comprises a connection selected from the group consisting of: Ethernet, fast Ethernet, gigabit Ethernet, Fibre channel, ATM, firewire, Myernet, SCSI, serial, parallel, universal serial bus, and wireless networks.

13. (original) The data storage system of claim 1 further comprising:  
storage management processes executing on one of the storage nodes to determine state information about each of the set of storage nodes.

14. (original) The data storage system of claim 1 wherein the communication medium comprises a secure communication medium.

15. (original) The data storage system of claim 1 wherein the communication medium implements an authentication protocol between linked storage nodes.

Serial No. 09/777,139  
Reply to Office Action of September 9, 2005

16. (original) The data storage system of claim 1 wherein the communication medium implements cryptographic security between linked storage nodes.

17. (currently amended) A method of managing data storage in a network comprising multiple storage nodes, the method comprising the acts of:  
communicating a storage request to at least one storage node; [[and]]  
causing the at least one storage node to implement the storage request using an arbitrary subset of the storage nodes[[]] ;  
communicating state information between the multiple storage nodes; and  
selecting the arbitrary subset of the multiple storage nodes to be used based upon the state information.

Claim 18 (cancelled)

19. (original) The method of claim 17 wherein the act of implementing the storage request comprises associating error checking and correcting (ECC) code with storage request.

20. (original) The method of claim 19 wherein the ECC code is stored in a single network storage node and the unit of data is stored in two or more network storage nodes.

21. (original) The method of claim 17 further comprising:  
retrieving a stored unit of data specified by the storage request; and  
verifying the correctness of the stored unit of data;  
upon detection of an error in the retrieved unit of data, retrieving the correct unit of data using data stored in the others of the arbitrary subset of the multiple storage nodes.

Serial No. 09/777,139

22. (previously presented) A method of managing data storage in a network comprising multiple storage nodes, the method comprising:

- communicating a storage request to at least one storage node;
- causing the at least one storage node to implement the storage request using an arbitrary subset of the storage nodes;
- attempting to retrieve the stored unit of data from the arbitrary subset of the multiple storage nodes;
- detecting unavailability of one or more network storage nodes; and
- in response to detected unavailability, retrieving the correct unit of data using data stored in others of the arbitrary subset of the multiple storage nodes.

23. (original) The method of claim 22 wherein the unavailability is caused by failure of one or more of the network storage nodes.

24. (original) The method of claim 22 wherein the unavailability is caused by congestion/failure of a network link leading to one or more of the network storage nodes.

25. (original) The method of claim 17 further comprising moving the stored unit of data from one network storage node to another network storage node after the step of storing.

26. (original) The method of claim 17 further comprising:

- communicating state information and storage requests amongst the arbitrary subset of the storage nodes; and
- encrypting at least some of the information and storage requests before communicating them between storage nodes.

Serial No. 09/777,139  
Reply to Office Action of September 9, 2005

27. (original) The method of claim 17 further comprising:  
communicating state information and storage requests amongst the arbitrary  
subset of the storage nodes; and  
authenticating the communication between storage nodes.

28. (previously presented) A data storage system comprising:  
a peer-to-peer network of three or more storage devices, each storage  
device having means for communicating state information with other storage  
devices, at least one storage device comprising means for receiving storage  
requests from external entities, and at least one storage device comprising means  
for causing read and write operations to be performed on others of the storage  
devices.

29. (original) The system of claim 28 wherein each of the storage devices  
comprises means for causing read and write operations to be performed on others  
of the storage devices.

30. (original) The system of claim 28 wherein each of the storage devices  
comprises data structures defined to configure at least two geographically distant  
ones of the data storage devices as a unitary volume of storage.

31. (original) The system of claim 30 further comprising:  
a network coupling to each of the data storage devices; and  
a storage controller coupled to the network for logically combining the at  
least two data storage devices into a single logical storage device.

Serial No. 09/777,139  
Reply to Office Action of September 9, 2005

32. (previously presented) A distributed data storage array comprising:  
a plurality of network connected storage nodes;  
a network interface within each storage node for receiving data and control information from other storage nodes;  
a network interface within at least one storage node for receiving data storage access requests from external sources; and  
storage management processes within the at least one storage node operable to distribute data storage for logically contiguous data across multiple storage nodes.

Claims 33-36 (cancelled)
